

CLAUSIO

Domain & Business Rules

A Business-Domain Specification for New Team Members

Version 1.0

Companion to the Clausio System Design Blueprint
July 10, 2026

Purpose & How to Read This Document

This document describes the business domain of Clausio — the product, its core concepts, and the rules that govern how it behaves. It is deliberately implementation-free. It answers what Clausio is and why it works the way it does, not how any of it is built.

It is written for anyone new to the team — a developer, product manager, designer, or tester — who needs to understand the business before reading a single line of code. Read this first; then read the System Design Blueprint, which describes the technical architecture. The two are companions: this document owns the vocabulary and the rules, and the Blueprint owns the machinery that enforces them.

A note on precedence: where this document states a business rule (for example, that an organization always has exactly one owner), that rule is the source of truth for behavior. The architecture exists to serve these rules, never the other way around.

Throughout, a handful of terms are capitalized because they are formal domain concepts — Platform, Organization, Workspace, Contract, User, Witness, Invitation, AI Analysis, and Audit Log. They are defined in Section 2 and used consistently everywhere else.

1. Product Vision

Clausio is a secure, AI-assisted workspace where an organization keeps, understands, and manages its contracts in one trustworthy place.

Contracts are where obligations, money, and risk actually live — yet they are dense, easy to misplace, and genuinely understood only by specialists. Renewal and expiration dates slip by unnoticed. Risky clauses hide in plain sight. Reviewing an agreement well often requires legal expertise that many teams do not have on hand. Clausio addresses this by giving every organization a single private home for its agreements, paired with an AI assistant that explains what each contract says in plain language and flags clauses worth a closer look — while always leaving the final judgment to a human.

What Clausio believes

- **Trust before features.** Clausio is a system of record. Nothing changes silently, and every meaningful action can be traced back to who did it and when.
- **AI assists, humans decide.** The AI reads and explains; it never edits a contract and never advises on whether to sign. People make decisions.
- **Strict isolation.** Each organization's data is completely private. One organization can never see another's contracts, people, or history.
- **Controlled external sharing.** An outside party can be given a narrow, temporary, read-only view of a single contract without ever becoming a member or gaining broader access.

Who uses it

Internal teams — legal operations, procurement, founders, and administrators — do the day-to-day work of uploading, reviewing, and analyzing contracts. Occasionally an external party (a Witness) is invited to view one specific agreement for confirmation, without joining the organization.

2. Core Concepts

These are the nouns of the Clausio domain. Everything else in this document is expressed in terms of them. They nest inside one another: the Platform contains Organizations; an Organization contains its people and a single Workspace; the Workspace contains Contracts; and each Contract accumulates Notes, AI Analyses, Witness access, and Audit history.

Platform

The Platform is Clausio as a whole — the single service that hosts many independent Organizations side by side. It is the top of the containment hierarchy. The Platform provides the entry point for onboarding new organizations and guarantees the wall between them, but it owns nothing about any single organization's contracts. Think of the Platform as the building, and each Organization as a private, sealed floor within it.

Platform Roles

Clausio itself is operated by a small set of platform-level roles that are entirely separate from the roles inside any customer Organization. Platform roles belong to Clausio, the service; Organization roles (Owner, Administrator, and Internal member) belong to individual customer Workspaces. Holding a platform role never makes someone a member of a customer Organization, and holding an Organization role grants no authority over the Platform. The two role systems never overlap.

Platform Super Admin — the highest level of authority over Clausio itself. This role provisions and governs customer Organizations but takes no part in their contract work.

- Create Organizations and assign each one its first Owner.
- Suspend Organizations when required.
- Archive Organizations that are being retired.
- Recover Organization ownership when a sole Owner becomes permanently unavailable.
- Manage platform users.
- View platform-wide analytics.
- Operate and maintain Clausio itself.

Support Engineer — a limited operational role focused on helping customers, whose access is narrow by default and elevated only when explicitly authorized.

- Troubleshoot Organizations and diagnose customer issues.
- View logs to investigate reported problems.
- Exercise only limited support access by default.
- Receive temporary elevated access solely when explicitly authorized, and only for as long as that authorization lasts.
- Never participate in customers' day-to-day contract management.

This firm boundary between operating the Platform and doing a customer's work is formalized as business rule BR-21.

Organization

An Organization is a tenant: the customer entity — a company, firm, or team — that adopts Clausio. It is the unit of identity, membership, and ownership. Every User (other than a Witness) belongs to exactly one Organization, and every Organization has exactly one Owner. All of an organization's people, contracts, and history live under it.

Organization Settings

Every Organization owns a set of configurable settings that shape how its Workspace looks and behaves. These are business-level preferences, controlled by the Organization (typically its Owner or Administrators), and they apply only within that Organization's own Workspace — never affecting any other Organization. They are described here purely as domain concepts.

- **Organization Name** — the display name shown throughout the Organization's Workspace and on materials shared from it.
- **Logo** — the Organization's mark, displayed across its Workspace.
- **Timezone** — the reference timezone used for dates, deadlines, and expiration tracking.
- **Language** — the preferred language for the Organization's interface and communications.
- **AI Provider** — which AI service the Organization uses for its analyses, chosen at the business level. The AI still follows every AI Rule in Section 9 regardless of the provider selected.
- **Notification Preferences** — how and when members are alerted — for example, ahead of upcoming contract expirations.
- **Contract Retention Policy** — how long contracts and their history are kept before archival, consistent with soft-deletion (BR-7) and the immutable audit trail (BR-13).
- **Branding** — the broader visual identity — colors and styling — applied to the Workspace and any witness-facing views.

Workspace

A Workspace is the private operational environment belonging to a single Organization. Where the Organization is the container of people and identity, the Workspace is the container of work: the Contracts, notes, AI Analyses, invitations, and audit history. Each Organization has exactly one Workspace, and the Workspace boundary is absolute — nothing inside one Workspace is ever visible from another.

It is important to be precise about what a Workspace is and is not. The Workspace is a conceptual business environment, not an independent entity of its own. The Organization is the actual owner of all data within it. Every Organization has exactly one Workspace, and the two are inseparable — the Workspace simply represents the Organization's private operational space where its work happens. Wherever this document says something lives “in the Workspace,” that thing is owned by, and belongs to, the Organization.

Contract

A Contract is the central artifact of Clausio. It begins as an uploaded document (typically a legal agreement), from which the system extracts readable text and to which members attach metadata such as title, counterparty, tags, and expiration date. Over its life a Contract gathers notes and AI Analyses. A Contract always belongs to exactly one Workspace and moves through a defined lifecycle (Section 6).

User

A User is a person with an identity inside an Organization. Every User has a role that determines what they may do — Owner, Administrator, or Internal member. Users are brought in by Invitation, become active, and may later be suspended or deactivated (Section 5). Witnesses are deliberately not Users; they are external and hold no account.

Witness

A Witness is an external party invited to view one specific Contract, in read-only mode, for a limited time, through a secure single-use link. A Witness has no account, no password, and no membership. Most importantly, a Witness never belongs to an Organization — they are a guest granted a keyhole view of exactly one contract and nothing else.

Invitation

An Invitation is the mechanism by which access is granted. There are two kinds. A member Invitation brings a new person into an Organization with an assigned role, turning them into a User once accepted. A witness Invitation grants an external party scoped, expiring, read-only access to a single Contract. Every Invitation is time-limited and will expire if not used.

AI Analysis

An AI Analysis is a generated, read-only interpretation of a Contract's text: a plain-language summary, a risk scan, or an answer to a specific question. Each Analysis is a permanent, timestamped record attached to its Contract. An AI Analysis explains a contract; it never modifies one.

Audit Log

The Audit Log is the immutable history of everything that happens inside an Organization. Every meaningful action — an upload, an edit, a deletion, a user or ownership change, a witness access, an AI run — is recorded as an append-only event capturing who did what, when, and what changed. Audit entries are never edited and never deleted.

3. Business Rules

These are the invariants of the domain — statements that must always hold true, regardless of how the system is implemented. They are the single source of truth for correct behavior; the lifecycles and rule sections that follow (Sections 4–10) elaborate on them. Each rule has an identifier for easy reference in discussions and tickets.

ID	Rule	Why it matters
BR-1	Every Organization has exactly one Owner at all times.	Guarantees a single, clear point of ultimate accountability for each tenant.
BR-2	Ownership can change only by explicit transfer; it is never simply removed or left vacant.	Prevents an Organization from ever becoming ownerless and orphaned.
BR-3	Every User (Owner, Administrator, or Internal member) belongs to exactly one Organization.	Keeps identity and membership unambiguous and tenant-scoped.
BR-4	Witnesses never belong to an Organization and never hold an account.	Keeps external parties outside the trust boundary of any tenant.
BR-5	Each Organization has exactly one Workspace, and data never crosses Workspace boundaries.	Enforces strict isolation: no organization can ever see another's data.
BR-6	A Contract belongs to exactly one Workspace — and therefore exactly one Organization — for its entire life.	A contract has a single, stable home and owner-organization.
BR-7	Deleted contracts are soft-deleted only — hidden from normal use but retained; they are never physically destroyed by a user action.	Preserves records for audit, recovery, and dispute resolution.
BR-8	A Witness may access only the single Contract they were invited to, only in read-only mode, and only until the invitation expires or is revoked.	Confines external access to the narrowest possible scope.
BR-9	Witness invitations are single-use and time-limited.	Limits the damage if a link is forwarded or leaked.
BR-10	AI never edits, signs, or deletes a Contract; it only reads contract text and produces analyses.	Keeps the contract of record authoritative and human-controlled.
BR-11	Every AI Analysis carries a disclaimer and never constitutes legal advice.	Prevents the product from being mistaken for a lawyer.
BR-12	AI answers only from the Contract's own text; it does not speculate or draw on outside knowledge.	Keeps analyses grounded and traceable to the source document.
BR-13	Audit logs are immutable — append-only, never edited and never deleted, by anyone.	Guarantees a trustworthy, tamper-evident history.

ID	Rule	Why it matters
BR-14	Every data-changing action produces an Audit Log event.	Ensures nothing meaningful happens without a trace.
BR-15	A Contract remains accessible even if automatic text extraction fails; text may be supplied manually.	A parsing failure never blocks the business from using a contract.
BR-16	Only Administrators and the Owner may delete a Contract; Internal members may not.	Restricts destructive actions to trusted roles.
BR-17	A person's login identity (email) is unique across the Platform.	Prevents ambiguous or duplicated identities.
BR-18	Contracts, notes, and analyses are visible only to members of their own Organization — plus a scoped Witness for the single shared contract.	Reinforces isolation at the level of individual artifacts.
BR-19	The Owner cannot be suspended or deactivated while still Owner; ownership must be transferred first.	Protects rule BR-1 from being violated through user management.
BR-20	Every authenticated request made by an Organization member is scoped to exactly one Organization.	Makes tenant isolation real in practice: a member can only ever reach their own Organization's data.
BR-21	Platform users operate Clausio itself and do not take part in customer Organizations' day-to-day work, except during an authorized support or recovery operation.	Keeps operation of the Platform cleanly separate from use of any customer Workspace.

Two of these rules deserve a note on their intent.

BR-20 (request scoping). Every action a member takes is carried out in the context of their one Organization. A member's request can never reach across into another Organization's Workspace, because the request is always bound to the Organization the member belongs to. This is the mechanism that makes the strict isolation of BR-5 real in practice: even if two organizations' data sat side by side, no member's request could ever see beyond their own. Isolation is therefore not merely a promise — it is enforced on every single request.

BR-21 (platform / customer separation). The people who operate Clausio are not members of the organizations they serve. Platform users provision, support, and recover Organizations, but they do not review contracts, run analyses, or otherwise perform a customer's work — unless a specific, authorized support or recovery operation requires it, and then only for as long as that operation lasts. This separation protects customer confidentiality, keeps accountability clear, and ensures that day-to-day contract work always belongs to an Organization's own members rather than to whoever operates the Platform.

4. Organization Lifecycle

An Organization moves through a small number of well-defined states from the moment it is provisioned until it is retired. The states are strictly ordered on the primary path, with one reversible loop (a suspended organization can be reactivated).

The states

CREATED — The Organization has been provisioned on the Platform but is not yet operational. A Workspace is reserved for it but empty, and it has no Owner. No real work can happen yet.

OWNER_ASSIGNED — A person has been designated as the Organization's single Owner. Accountability is now established, and the Owner can begin configuring the organization and inviting members. This is a distinct setup state, just short of full operation.

ACTIVE — Full, normal operation. Members can be invited, contracts uploaded, AI Analyses run, and witnesses invited, each according to their role. An organization spends the vast majority of its life here.

SUSPENDED — A temporary, reversible freeze. Members cannot perform actions and access is blocked, but nothing is deleted and all data is preserved untouched. This may be triggered by the Platform (for example, for a policy or billing concern) or requested by the Owner.

ARCHIVED — The terminal state. The Organization has been permanently retired. Its Workspace is closed to new activity, but its contracts and complete audit history are retained for recordkeeping and compliance.

The transitions

Transition	What happens, and why
CREATED → OWNER_ASSIGNED	The first Owner is designated. This step is mandatory — an Organization cannot proceed without an Owner. Assigning the Owner establishes ultimate accountability and satisfies the “exactly one Owner” invariant (BR-1).

Transition	What happens, and why
OWNER_ASSIGNED → ACTIVE	The Organization is opened for normal use once the Owner is in place and any onboarding requirements are met. From here, all role-appropriate features become available.
ACTIVE → SUSPENDED	The Organization is temporarily frozen — by the Platform (billing, policy, or a security concern) or at the Owner's request. Actions are blocked; data is left completely intact so the freeze can be undone.
SUSPENDED → ACTIVE (reactivation)	Once the cause of suspension is resolved, the Organization is reactivated and returns to full operation exactly as it was. This is the one reversible loop in the lifecycle.
SUSPENDED → ARCHIVED	The Organization is being permanently wound down. Its Workspace is closed to new activity while all records are preserved. This step is irreversible through normal business flows.

Note: *Archival is effectively terminal. Bringing an archived Organization back, if ever permitted, is an exceptional Platform-level recovery action rather than an ordinary business transition.*

5. User Lifecycle

A User (a member of an Organization) moves through the states below from invitation to eventual retirement. As with organizations, there is one reversible loop: a suspended user can be reactivated.

The states

INVITED — A member Invitation has been issued for a person (identified by email) with a chosen role, but they have not yet accepted. They cannot do anything until they join. The invitation carries an expiry.

ACTIVE — The person has accepted and is a full member. They can do everything their role permits (Owner, Administrator, or Internal member).

SUSPENDED — A temporary, reversible disablement — for example during a leave of absence, a suspected account compromise, or an investigation. The account and all of the user's history are preserved, but they cannot sign in or act.

DEACTIVATED — The terminal state for a member. The person has left or been removed and can no longer access anything. Their record and the history they authored (notes, uploads, audit trail) are retained for integrity; they are never erased.

How Members Join: The Invitation Flow

People never sign themselves up for Clausio. There is no public registration page. Every Organization member joins through an explicit Invitation issued by someone already inside the Organization, which keeps membership fully controlled and traceable.

- **Invite.** An Owner or Administrator begins by inviting a person (identified by email) and choosing the role they will hold.
- **Token generated.** A unique, time-limited invitation is generated for that specific person.
- **Delivered.** The invitation is delivered to the invited person.
- **Password set.** Using the invitation within its validity window, the person sets their password and establishes their account.
- **Active.** They become an ACTIVE member with the role they were assigned.

Because the only way in is by Invitation, an Organization always knows exactly who its members are and who invited them. An invitation that is not used before it expires cannot be used to join, as described next.

Invitation expiration

A member Invitation is valid only for a limited window. If it is not accepted before it expires, it becomes invalid and can no longer be used to join. An expired invitation never creates an active user. To bring the person in afterward, an Administrator or the Owner must issue a fresh Invitation.

Reactivation

A suspended user can be reactivated by an Administrator or the Owner, returning them to the ACTIVE state with their original role, identity, and history intact. Reactivation is only possible from SUSPENDED. A DEACTIVATED user is not reactivated; re-admitting that person is done through a new Invitation rather than by reviving the old record.

The transitions

Transition	What happens, and why
INVITED → ACTIVE	The invited person accepts and establishes their credentials within the validity window, becoming a full member with the assigned role.
INVITED → (expired)	The invitation window closes before acceptance. The invitation becomes unusable and no user is created; a fresh Invitation is required.
ACTIVE → SUSPENDED	An Administrator or the Owner temporarily disables the user. Access is blocked; the account and its history are preserved for later reactivation.
SUSPENDED → ACTIVE (reactivation)	An Administrator or the Owner restores the user, who regains their prior role and access unchanged.
ACTIVE / SUSPENDED → DEACTIVATED	The user is retired from the Organization — having left or been removed. Access ends permanently while their authored history is retained. Deactivation may occur from either the active or suspended state.

Owner exception: *the Owner cannot be suspended or deactivated while still Owner. Ownership must first be transferred to another member (see Section 7), preserving the single-Owner invariant BR-1.*

6. Contract Lifecycle

A Contract progresses from a freshly uploaded document to a settled, archived record. The path is largely forward-moving, but two things are worth noting up front: the Witness stage is optional (many contracts never need an outside viewer), and the AI Processing and Reviewed stages may repeat as new analyses are run or metadata is revised.

The states

Uploaded — The contract document has just entered the Workspace. The original file is stored intact and its integrity recorded, along with basic metadata. Its content is not yet machine-readable.

Extracted — The system has pulled the readable text out of the document so it can be searched, displayed, and analyzed. If automatic extraction fails, the text can be supplied manually — a contract is never blocked from progressing solely because extraction failed (BR-15). Once text exists, the contract is ready for AI.

AI Processing — One or more AI Analyses run against the extracted text: a plain-language summary, a risk scan, or targeted questions. Results are attached to the contract as read-only records. The contract itself is never changed by this step (BR-10).

Reviewed — A human member examines the contract and its analyses, adds notes, confirms or corrects metadata such as counterparty and dates, and forms a judgment. This is the point at which responsibility rests explicitly with a person rather than the AI.

Witness — An optional stage in which the contract is shared with an external Witness for read-only confirmation through a scoped, expiring link. It covers cases where an outside party must see the agreement without joining the organization. Many contracts skip this stage entirely.

Completed — Active handling is finished: the contract has been reviewed, any witnessing is done, and its obligations are understood and recorded. It is now a live, settled record in the Workspace, tracked for events such as upcoming expiration.

Archived — The contract is retired from day-to-day view but retained in full for recordkeeping and audit. Consistent with the soft-deletion rule (BR-7), archival hides a contract but never erases it.

Notes on movement

- **Optional stages.** The Witness stage is optional and is skipped when no external viewer is needed.
- **Repeatable stages.** AI Processing and Reviewed can recur — new analyses may be run and metadata revised as understanding of a contract deepens.
- **Soft deletion.** A contract can be soft-deleted (hidden) at any stage. It is never physically destroyed and its history is always preserved.

7. Ownership Rules

Ownership is the backbone of accountability in Clausio. Every Organization has one, and only one, Owner — the single principal ultimately responsible for the tenant.

- **One Owner, always.** Exactly one Owner exists per Organization at all times. This is a non-negotiable invariant (BR-1), never allowed to drop to zero or rise above one.
- **Owner versus Administrator.** The Owner can do everything an Administrator can, and is additionally the single accountable principal for the Organization. There may be many Administrators, but only one of them holds the Owner title.
- **Ownership is transferred, never dropped.** An Owner cannot simply be deleted, suspended, or allowed to walk away. To leave, they must first transfer ownership to another eligible member — typically an Administrator. This guarantees the Organization is never left ownerless (BR-2, BR-19).
- **How a transfer works.** When ownership is transferred, the new person becomes the sole Owner and the previous Owner steps down to a regular Administrator. The change takes effect as a single, atomic action so there is never a moment with two Owners or none.
- **Who can transfer.** Only the current Owner may initiate a transfer. The one exception is an exceptional Platform-level recovery action if the sole Owner becomes permanently unavailable (see Section 11).
- **Always audited.** Every ownership change is recorded in the Audit Log, capturing who transferred to whom and when.

The reason for all of this is continuity: an Organization must always have a clear, single point of authority and escalation, and it must never become an orphaned tenant that no one is responsible for.

8. Witness Rules

A Witness lets an outside party — an external counsel, a signatory, or an auditor — verify one specific agreement without gaining any broader foothold in the organization.

- **Never a member.** A Witness is external and holds no account. They are never a member and never belong to an Organization (BR-4).
- **Bound to one contract.** Access is granted only through a witness Invitation tied to exactly one Contract. The invitation cannot be used to reach any other contract (BR-8).
- **Read-only, and only that.** A Witness can view the single contract and its document, and nothing more. They cannot edit, add notes, run AI, or browse the Workspace. Internal artifacts such as notes and AI Analyses are hidden from them.
- **Time-limited.** Every witness Invitation carries an expiry. After it passes, access is denied (BR-9).
- **Single-use.** A witness Invitation is intended for a single access session. First use is recorded, so a forwarded or leaked link cannot quietly grant ongoing, broad access.
- **Revocable.** An Administrator or the Owner can revoke a witness Invitation before it expires, cutting off access immediately.
- **Fully audited.** Witness access is recorded distinctly in the Audit Log — which invitation, which contract, and when — so the Organization always knows exactly who viewed what.

Taken together, these rules let an organization prove and share a single agreement with an outsider while keeping the rest of its Workspace completely private.

9. AI Rules

The AI is an assistant that helps people understand contracts faster. Its authority is deliberately limited: it explains, but it never decides and never changes anything.

- **Assists, never decides.** The AI reads contract text and explains it. Humans make every decision. Its output is advisory and explicitly non-binding — it is never authoritative for any binding decision.
- **Never edits contracts.** The AI cannot change a contract's text, metadata, or status. Every result is a separate analysis record attached to the contract, leaving the contract of record untouched (BR-10).
- **No legal advice.** The AI never advises on whether to sign and never gives legal advice. Every analysis carries a clear disclaimer to that effect (BR-11).
- **Grounded in the document.** The AI answers only from the contract's own text. It does not invent facts or rely on outside knowledge; if the contract does not address something, it says so plainly (BR-12).
- **Recorded and traceable.** Analyses are permanent, timestamped, read-only records, so there is always a history of what was asked and what was answered.
- **What it produces.** Three kinds of analysis are supported: a plain-language summary of obligations, payment, and termination; a risk scan that flags categories such as auto-renewal, uncapped liability, one-sided indemnification, unusual intellectual-property assignment, non-compete, and clawback, each with a severity rating; and clause investigation, answering a single question from the text.
- **Confidentiality.** Contract content handled by the AI is treated as confidential and is not exposed in general system activity records.

The intent throughout is to keep a human firmly in control, to avoid any appearance of practicing law, and to prevent the AI from asserting authority it does not have.

10. Audit Rules

The Audit Log is the Organization's permanent, trustworthy memory. It is what makes it possible to say with confidence exactly what happened, who did it, and when.

- **Append-only and immutable.** Audit entries are only ever added. They are never edited or deleted — by anyone, including Administrators and the Owner (BR-13).
- **Comprehensive.** Every data-changing action generates an event: contract uploads, edits, and deletions; metadata changes; user invitations, role changes, suspensions, and deactivations; ownership transfers; witness link creation, use, and revocation; and AI runs (BR-14).
- **What each event captures.** Each event records who acted, what they did, when it happened, and the before-and-after of what changed, along with relevant context about the request.
- **Witness access is distinct.** Witness access is recorded distinctly, referencing the specific witness Invitation involved.
- **Isolated per organization.** Audit records are scoped to their Organization. One organization never sees another's audit trail (BR-5, BR-18).
- **History outlives deletion.** Deleting or retiring something never deletes its history. When a contract is soft-deleted, a user is deactivated, or an organization is archived, the audit trail survives.
- **Available for oversight.** Administrators and the Owner can review the audit trail for oversight, whether per contract or per user, according to their role.

The purpose is trust: supporting compliance, resolving disputes, and allowing anyone with the right authority to reconstruct precisely what took place.

11. Future Business Rules

The rules below are anticipated directions for the domain, not yet in effect today. They are recorded here so the team shares a common view of where Clausio is heading. Every future rule must continue to honor the core invariants of Section 3 — strict isolation, an immutable audit trail, an AI that never edits, soft-deletion only, and exactly one Owner per Organization.

- **Expiration and renewal alerts.** Proactive notifications ahead of expiration and auto-renewal dates, so obligations and deadlines are never missed.
- **Multi-witness and signing flows.** Support for more than one witness on a contract, or a sequential attestation or e-signature flow, while keeping each witness scoped and read-only.
- **Approval workflows.** Optional designated approvers who must sign off before a contract can move to Completed.
- **Delegated and granular roles.** Finer-grained roles beyond Owner, Administrator, and Internal — for example read-only internal members or department-scoped access.
- **Organization-to-organization sharing.** Controlled sharing of a specific contract between two consenting Organizations, without weakening isolation anywhere else.
- **Team sub-spaces.** Partitioning contracts by team or department inside a Workspace, while preserving organization-level oversight.
- **Retention and legal hold.** Configurable retention windows, plus legal holds that override normal archival and deletion when records must be preserved.
- **Bulk import and templates.** Onboarding large existing sets of contracts at once, and standard contract templates for new agreements.
- **Enhanced AI capabilities.** Comparison across contracts, extraction of obligations into trackable tasks, and reusable clause libraries — all remaining read-only, non-editing, and non-binding.
- **Owner succession and recovery.** A defined process for reassigning ownership if the sole Owner becomes permanently unavailable, executed by the Platform under strict controls.
- **Data export and portability.** The ability for an Organization to export its full Workspace — contracts, metadata, and audit history — on request.

Appendix A. Actors at a Glance

A quick reference to the people and roles that interact with Clausio. This summarizes concepts defined more fully in Sections 2, 7, and 8.

Role	Belongs to an Organization?	What they do
Owner	Yes (exactly one)	Everything an Administrator can do, plus ultimate accountability for the Organization. The single transferable owner of the tenant.
Administrator	Yes	Manages users, contracts, settings, witness links, and audit review. May delete (soft) contracts. There can be many Administrators.
Internal member	Yes	Day-to-day contract work: upload, view, edit metadata, add notes, run AI. Cannot manage users or delete contracts.
Witness	No	External guest with read-only access to one contract via an expiring, single-use link. Not a member; no account.
Platform Super Admin	No (operates the Platform)	Runs Clausio itself: creates Organizations, assigns first Owners, suspends and archives Organizations, recovers ownership, and manages platform users and analytics.
Support Engineer	No (operates the Platform)	Limited platform support: troubleshoots Organizations, views logs, and diagnoses issues. Elevated access only when explicitly authorized; never performs customers' contract work.

Appendix B. Glossary

Term	Meaning
Platform	Clausio as a whole; the multi-tenant service that hosts many Organizations and guarantees isolation between them.
Organization	A tenant — the customer entity that adopts Clausio; the unit of identity, membership, and ownership.
Workspace	The private operational environment of a single Organization — a conceptual business space, not an independent entity. The Organization owns all data, and each Organization has exactly one Workspace.
Contract	The central artifact: an uploaded agreement with extracted text, metadata, notes, and analyses, moving through a defined lifecycle.

Term	Meaning
User	A person with an identity and role (Owner, Administrator, or Internal member) inside one Organization.
Witness	An external, accountless party granted read-only access to a single contract for a limited time.
Invitation	The mechanism granting access — either bringing a member into an Organization or granting a Witness scoped access to one contract.
AI Analysis	A read-only, generated interpretation of a contract's text: a summary, a risk scan, or a question answered from the text.
Audit Log	The immutable, append-only history of every meaningful action taken within an Organization.
Soft deletion	Hiding a record from normal use while retaining it in full for audit and recovery; the record is never physically destroyed.

End of document — Clausio Domain & Business Rules, v1.0
